Application No. 05227339 , **Filed** 19930913 , **Published** 19940708

Abstract:

PURPOSE: To provide the schedule management system employing a schedule protection system which can eliminate problem points at the time of the new setting of a schedule.

CONSTITUTION: The schedule management system is provided with an information storage device A which stores schedule information having attribute information on schedule time and its schedule priority order, etc., as a data base; and a registering means B is provided with a means E which decides the overlap of the schedule time and a means F which compares and decides the schedule priority order. When a schedule is newly set, the overlap between the schedule time of the schedule to be set and the schedule time of a schedule which is already set and registered in the data base is decided and if there is the overlap, the schedule priority orders of those schedules are compared and decided. When there is the overlap of schedule time, the schedule to be set can be set on condition that the priority order of the schedule is high.
